

Specialized E150 Fork Spike Valve Settings (2007 & 2008 Series)

Translated from a conversation with of Mick McAndrews;

The Spike Valve is factory set at Spike Valve is to be set at 55 psi +/- 5psi and should remain-so without deviance

The Spike Valve settings are not something intended by the manufacturer to be tampered or experimented with downstream of the point of sale by the owner. Applying alternative pressures is not seen as a way to overcome ride quality issues or the likes; the Spike Valve merely operates as a "trigger release" and riding with alternative Spike Valve pressures may prejudice suspension quality

It is acknowledged that Bike Shops themselves have been prone to providing alternative Spike Valve pressures and Specialized are in the process of communicating a directive/reminder of the correct pressures advised above, to all of their Distributors
