

Advice from Specialized for owners considering undertaking E150 Fork servicing or maintenance procedures

Advice provided by Mick McAndrews;

Owners can perform ****basic**** maintenance to their suspension and Specialized shall still honour the warranty. Any modifications to the suspension will ****void**** the warranty. The fork service document contained within this library folder provided by Specialized is classified as being a 'basic' maintenance guide.

Although Specialized's guide incorporates much of the information contained within the 'Kelstr E150 "Slick Honey" & alignment owner maintenance document'; one point contained therein which Specialized do not recommend, is the addition of an excessive amount of oil into each fork leg. 20cc's of 10 wt is what is recommend by Specialized

The determining factors affecting how often the fork needs to be serviced relates to riding conditions. Riding in sandy, muddy, wet, and/or fine silty conditions will shorten the time intervals between fork servicing. Riding in areas where these harsh conditions are not prevalent will increase the time interval between fork services. Depending on the riding conditions 40-100 hours between fork service periods is recommended. Any sign of a reduction in fork performance is a good indicator the fork is due for a basic maintenance service
