

Specialized caution note attached to service interval criteria relating to Basic E150 Service Manual provided

If your fork's cartridge internals are due for a full service (recommended every 250hrs of ride time), please contact your local bike shop and have your respective market's Service Center service the cartridges

The basic maintenance guide solely applies to the greasing of the seals and placing a fresh oil bath in the lowers. It is suggested to provide the basic maintenance guide to your local bike shop and have them provide your fork with a basic maintenance service. This will help your fork work well between scheduled full service intervals

A preference is to use 20cc's of 10 wt. BelRay oil in each fork leg when maintaining the fork. The Spike Valve should be set to 55 psi. A guideline rule of thumb would be to provide a basic maintenance to the fork every 50-80 hours of ride time, depending on how harsh of conditions which the bike is generally ridden

It is not recommended to open-up the cartridge internals as this will affect the Fork's warranty
